

Three scientific questions; three uncertain benefits

Recorded primary comparisons reuse the same 14 development people and 3 seeds

1 Does feature prediction help?

Core JEPA/change versus direct/change

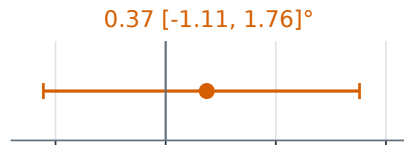

Response · crossed person/seed 95% interval

2 Does a feature difference help?

Delta/change versus endpoint/change

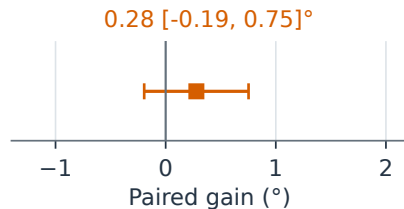

Response · crossed person/seed 95% interval

3 Does dense supervision help?

Delta/dense versus delta/low scalar

ViTPose trajectory · person-t 95% interval

Positive gains favor the candidate. Outcomes and interval procedures differ; there is no pooled effect. Every interval crosses zero. The first comparison uses direct/change, not the stronger direct-coordinate model.
