

Rare failures contribute materially to the response score

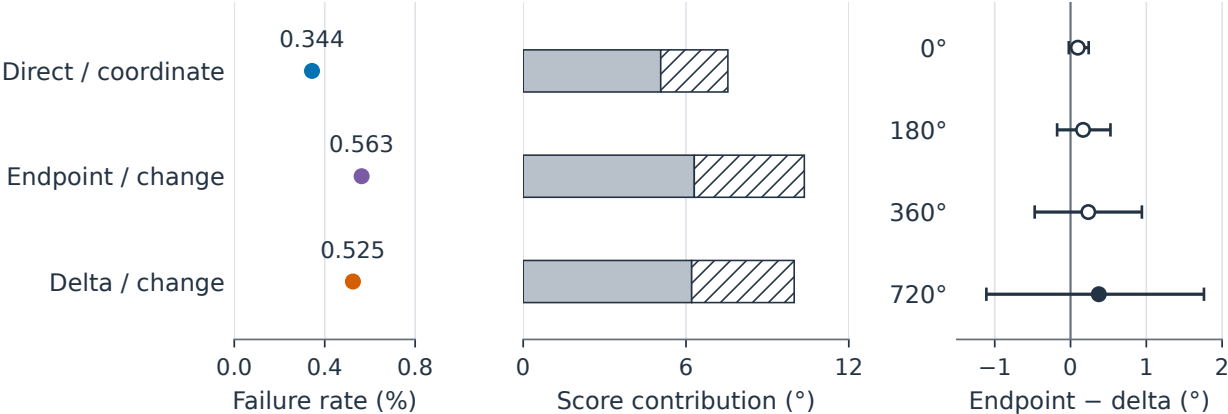

The score retains failed measurements; conditional successful error is a different quantity

Successful contribution (all cases) Failure rate $\times 720^\circ$

A Failure rate

B Score components

C Cost sensitivity

14 people $\times$ 3 seeds. A-B: descriptive means. C: paired 95% crossed-bootstrap intervals; all cross zero. 720° is the original cost; other costs are exploratory. At zero cost, failures remain with zero error. Endpoint/delta successful contributions ($6.31^\circ/6.21^\circ$) already exceed zero response (5.81°).
