

Three evaluation approaches, three limited questions

All 96 examples divided at random

Can the features recover labels
inside the known set?

Source videos can appear
on both sides.

Matched comparison 47 training, 21 testing

Can we repeat the historical
comparison?

Source videos can appear
on both sides.

Source videos kept separate

What changes when the final
classifier cannot share videos?

Earlier feature learning still
used every video.

Each approach answers a different question; none estimates a completely unseen video from start to finish.
