

Real equivariance ladder, preregistered verdict: NO CREDIT

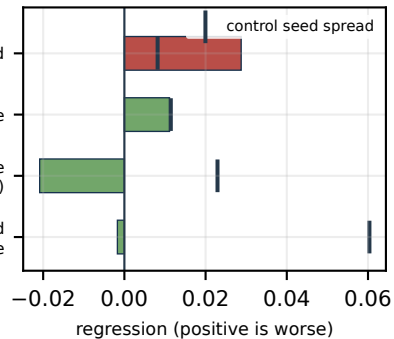

**Primary endpoint improves
by 0.403, control
spread 0.057**

**Paired over 18 source videos
95% interval [1.12, 2.29]**

**Guardrails against the
control's own seed spread**

2 of 3 credit conditions met, and all three are required. Failed: condition 3 no guardrail regression.
The head's output scale rose from 0.75 to 1.06, so the endpoint did not improve by the readout collapsing.
