

A staged workflow keeps development and confirmation distinct

Use the available cache first; acquire new teacher evidence only for the question that needs it.

1

Audit and calibrate

Trace notebooks; verify arithmetic; test known symmetry and order signals.

2

Freeze the cached panel

Fix support/current-posture references, grids, controls and source partitions.

3

Fit and reconstruct

Train-only transforms; inner selection; outer predictions; paired uncertainty.

4

Test future targets

New physical-time windows and mirrored teacher encoding; causal input audits.

5

Compare student training

Ordinary S-JEPA, full targets, selected targets and exact no-transfer option.

6

Confirm on new sources

Freeze one method and endpoint; include subject-separated evidence.

Stages 1-3 can use current cached arrays. Later stages need additional empirical evidence.
