

Measure teacher information accessible to the student

RGB complementarity and skeleton-only temporal learning are separate questions.

EXISTING QUESTION

RGB prefix + support $\rightarrow$ contextual future Y
Does adding skeleton history improve prediction?

NEW DEVELOPMENT QUESTION

Current posture + support $\rightarrow$ contextual future Y
What does ordered skeleton history add?

H: student input

Coordinates, quality and timing
Observed frames 0-31 only

C: current-state reference

Frame-31 posture + support
C is a declared function of H

Y: teacher target

Frozen contextual features
Training supervision only

History contribution: $E[Y | H] - E[Y | C]$

A population definition; finite fitted models still require held-source tests.

Current cache Y uses full-clip context. A future-only target requires new encoding and audits.
