

Learning clip correspondence does not establish useful laterality features

625 clips · 93 source videos · five outer folds · five seeds

Panel A: large dots are mean seed scores; small open dots are the five seed scores, not confidence intervals. Motion summaries add variation, feature changes, and support.

Panel C: 95% intervals use 2,000 paired source-video resamples, conditional on fitted models. Each mask has its own count-matched random reference; intervals do not establish equivalence.
